DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 2/13/2009 has been entered.

Claim Rejections - 35 USC § 103

The rejection of claims 1-3 and 8-9 under 35 U.S.C. 103(a) as being unpatentable over Sano (JP 11-062631), in view of Farrell et al. (US 5,522,416.) has been overcome by applicant's amendment to the claims.

The rejection of claims 4-7 under 35 U.S.C. 103(a) as being unpatentable over Sano (JP 11-062631) in view of Farrell et al. (US 5,522,416), and further in view of Dell et al. (CA 2,261,243) has been overcome by applicant's amendment to the claims.

Allowable Subject Matter

Claims 1-3 and 5-9 are allowed.

The following is an examiner's statement of reasons for allowance.

The instant claims are to a pressure regulator for fuel cells, which is disposed in a discharge line for discharging an oxidizing agent supplied to a cathode of fuel cells, for

controlling a discharged amount of the oxidizing agent to regulate the pressure of the oxidizing agent in the cathode, comprising an opening for passing said oxidizing agent there through, a valve body for opening or closing said opening; a resilient member for urging a rotational shaft to which said valve body is connected, to turn in a direction to open said opening, wherein said rotational shaft is supported by a bearing; a sealing member disposed between said bearing and said opening, wherein the sealing member comprises a first lip inclined away from the opening and a second lip inclined toward the opening; a limiting member for limiting an angular position of the valve body which is turned by said resilient member, to keep said opening fully open; and a motor energizable for turning said valve body in a direction to close said opening against resilient forces of said resilient member, wherein when the non-contact type motor is de-energized, the opening is fully open for discharging water from the fuel cells without consuming electric power, and an opening sensor for detecting a magnetic field from a magnet embedded in said rotational shaft thereby to detect an angular position of said rotational shaft.

The prior art does not teach a pressure regulator for fuel cells, which is disposed in a discharge line for discharging an oxidizing agent supplied to a cathode of fuel cells, for controlling a discharged amount of the oxidizing agent to regulate the pressure of the oxidizing agent in the cathode, comprising the claimed elements. The most pertinent prior art has been made of record.

For example, Sano (JP 11-062631) teaches a regulator comprising an opening for passing a fluid, a valve body for opening or closing said opening; a resilient member for urging a rotational shaft to which said valve body is connected, to turn in a direction to open said opening; a limiting member for limiting an angular position of the valve body; and a motor energizable for

turning said valve body in a direction to close said opening against resilient forces of said resilient member. The motor is a stepping motor, which is a brushless motor. Sano does not teach an opening sensor for detecting a magnetic field from a magnet embedded in said rotational shaft thereby to detect an angular position of said rotational shaft, a sealing member is disposed between the bearing and the opening of the regulator or a first lip in the sealing member inclined away from the opening and a second lip inclined toward the opening. Further, the reference does not teach that when the non-contact type motor is de-energized, the opening is fully open for discharging water from the fuel cells without consuming electric power.

Farrell et al. (US 5,522,416) teaches a pressure regulator having an opening, a valve body, and a motor, including a means for indicating the angular position of a rotor including a magnet fitted to the rotor and a sensor mounted in the housing. The motor is a non-contact type motor as it connected through a coupled. Farrell does not teach a sealing member is disposed between the bearing and the opening of the regulator or a first lip in the sealing member inclined away from the opening and a second lip inclined toward the opening. Further, the reference does not teach that when the non-contact type motor is de-energized, the opening is fully open for discharging water from the fuel cells without consuming electric power.

Because the prior art does not disclose the claimed invention or provide teachings that would lead one of ordinary skill in the art at the time the invention was made to find the invention obvious over the prior art, the claims are allowed. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
